LifeTrack — Personal Productivity Tracker

A complete, modern, responsive web app for organizing daily activities, tracking personal habits, managing goals, and monitoring productivity.

No backend. No paid APIs. No frameworks. Just HTML, CSS, and vanilla JavaScript, with all data stored in the browser's LocalStorage.

Features

Dashboard

- Today's tasks at a glance
- Completed / pending task counts
- Daily task completion percentage with a progress bar
- Active goals with progress bars
- Habit completion summary and a weekly check-in bar chart

Task management

- Add, edit, and delete tasks (title, description, due date, priority)
- Mark tasks as completed
- Filter by status (all / pending / completed), priority, and date
- View tasks for any selected date

Habit tracker

- Create and delete habits — Exercise, Reading, and Drink Water are included as samples
- Check a habit off for each day
- Weekly grid (Monday–Sunday) with per-habit completion progress
- One completion entry per habit per day — duplicates are impossible by design

Personal goals

- Create, edit, and delete goals (title, description, target date, progress)
- Update progress with a slider or +10 / −10 buttons
- Progress bar for every goal

Data storage

- Everything (tasks, habits, goals, habit check-ins) lives in LocalStorage
- Data survives browser refreshes
- All inputs are validated; destructive actions ask for confirmation first

Sample data

- A few fictional tasks, habits, and goals are included so you can explore immediately
- Use **Clear sample data** in the sidebar to remove only the samples — your own items are never touched

Project files

File	Purpose
`index.html`	App structure and all views
`style.css`	Calm, minimal, responsive styling
`script.js`	All app logic and LocalStorage code
`README.md`	This file

Run it locally

Just open `index.html` in any modern browser. Or serve the folder:

```
cd lifetrack
python3 -m http.server 8000
```

Then visit http://localhost:8000

Deploy to GitHub Pages

1. Create a new repository on GitHub (public or private).
2. Push these four files to the repository's `main` branch, at the repo root.
3. On GitHub, go to **Settings** → **Pages**.
4. Under **Build and deployment** → **Source**, choose **Deploy from a branch**.
5. Select the `main` branch and the `/ (root)` folder, then save.
6. Your site will be live at `https://<your-username>.github.io/<repo-name>/` within a minute or two.

Because the app uses only LocalStorage, there is nothing else to configure — no server, no database, no API keys.

Accessibility & responsiveness

- Labels on every form control, keyboard-friendly modals (Esc closes them)
- Sidebar navigation collapses into a top bar on small screens
- Cards, grids, and filters reflow for mobile

License

Free to use and adapt for personal projects.
